

ABSTRACT OF THE INVENTION

A building structure that consists of several individual theaters each of which has three distinct levels. There is a balcony level for first class patrons with separate entrance and exit areas. There is a lower viewing level for regular class patrons. The projection level is for motion picture projection equipment and is located between the upper and the lower viewing levels. This gives all patrons of the theater an optimal look and feel for the reality of the motion picture shown on the projection screen. Additionally multiple audio speakers are located throughout the theater empirically so as to eliminate sound dead spots.
